Note: DST has been factored into the calculations in this report and can be set in the locations screen

The phase of the moon is expressed as the percentage of the moon that is lit. A '+' indicates a waxing (growing) moon, while a '-' indicates a waning (shrinking) moon. The phase of the moon is now calculated as at midnight (00:00) on the reported day.

Major and minor times on this report are the mid point of the activity period. Major periods can last up to 2 hours on the best days down to around 1 hour or less on the poor days. Minor periods can last around an hour on the best days, down to around half an hour on the poor days. Ratings for the minor periods are typically 1 star less than for the major periods on that day.

In addition to the major and minor times shown, sun rise and sun set are also times of increased activity due to the interchange of large nocturnal predators and smaller daytime feeders starting/finishing their feeding cycles and therefore moving around at the same time.

Tide times/heights can be calculated using Michael Hopper's excellent WXTide32, available from simtel.net
